

WEATHER OBSERVATION DATA

Applicable Area : Public / Daily life

Application : Remote monitoring of weather observation data

- At ski resorts in mountainous areas, there is a risk of accidents due to snow accumulation; weather data is used to determine the need for emergency measures. The DL8 provides remote monitoring of weather observation data from around the mountaintop area using the measurement values of temperature, humidity, wind direction, wind velocity, rainfall, snow accumulation and others.
- Threshold alarm values can be set for each weather data signal, and e-mail notifications are sent when the measured value exceeds the threshold.
