INPUT DATA DESCRIPTIONS

■ ANALOG DATA (TEMPERATURE DATA)

16-bit binary data.

With $^{\circ}\text{C}$ temperature unit, raw data is multiplied by 100. For example, 25.5°C is converted into 2550.

With $^{\circ}\text{F}$ temperature unit, raw data is multiplied by 10. For example, 135.4°F is converted into 1354.

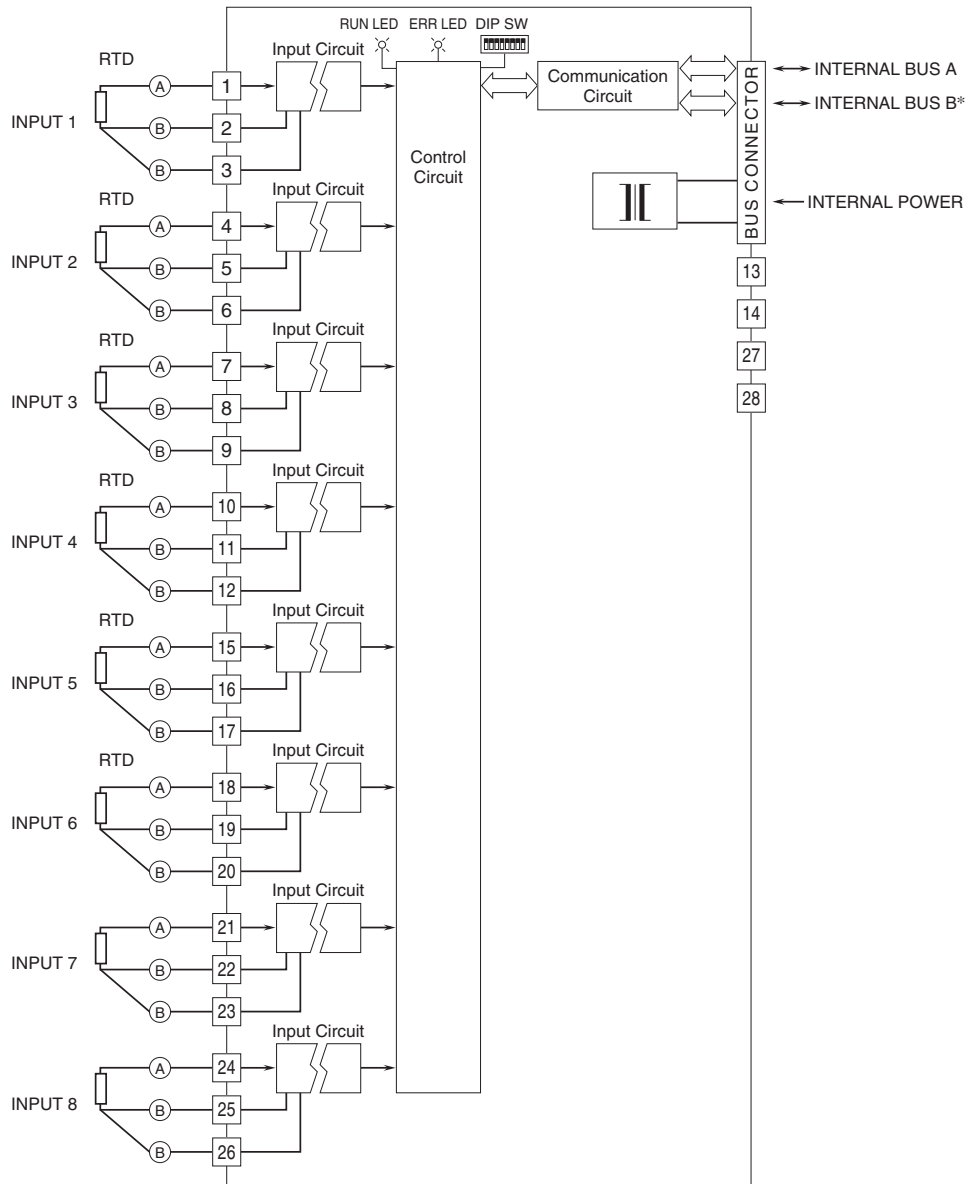

Minus temperature is converted into negative values, represented in 2's complements.

SCHEMATIC CIRCUITRY & CONNECTION DIAGRAM

*For dual redundant communication.

• Unused Input Channels

Close across the unused input terminals with a resistor as shown below and set the DIP switch for an RTD. The resistance value must match the RTD type (100Ω for Pt 100).

Unused channels left open are equal to the burnout, which turns the red ERR LED on and sets a burnout flag at the PLC or the host device.

Unused channels can be specified and set so on the PC Configurator Software (model: R3CON) without needing to connect resistors at the field terminals.

Specifications are subject to change without notice.
