## FUNCTIONS

### Output hold function:

In normal conditions, the module outputs the signal from the preferred internal bus A.

When an error is detected, the output is switched to the data from the internal bus B.

If both are in error, when the DIP switch on the side panel is OFF, the module holds and output the last received data.

When the DIP switch 1 is ON, the module holds and output -15 % of the selected range (approx. 1.6 mA).

Either internal bus A or bus B becomes normal, output recovers.
