## ■ OUTPUT AT THE LOSS OF COMMUNICATION

| OUTPUT 1 to 8 | $\square$ OUTPUT HOLD | OUTPUT HOLD | $\square$ |
|  | $\square$ OUTPUT OFF |  | $\square$ |

## ■ OUTPUT HOLD or OUTPUT OFF

In normal conditions, the module outputs the signal from the preferred bus $A$. When an error is detected, the output is switched to the data from the bus B.

- Output Hold

If both are in error, the module holds the signal and stands by until one of the communications recovers.

- Output OFF

If both are in error, the module outputs $-15 \%$ (or approx. -11.5 V ) and stands by until one of the communications recovers.
At the startup, it outputs $-15 \%$ (or approx. -11.5 V ) until the communication is established and normal data is received.

## - DATA RANGE

Set zero and full scale to each channel (zero scale to full scale)
